

*The Linux Users' Group of Davis presents:*

# **Configuration Management with *Puppet:***

## **Present and Future**

Puppet is an open-source configuration management tool. It runs on many Unix-like systems as well as on Microsoft Windows, and includes its own declarative language to describe system configuration.

In this talk, Greg Larkin, an engineer with Puppet Labs, will discuss some of the historical issues with system management, how Puppet works, how it fits into current types of infrastructure deployments and what some of its enterprise features are. The talk will touch on high-level concepts as well as show some code and how it enforces node configurations. The talk will also cover new Puppet developments that were recently announced during PuppetConf 2015.

Monday, April 18<sup>th</sup>, 2016  
7:00pm – 9:00pm  
Free & open to the public!
